

COMMAND CENTER

Project Brief
March 2026

Project Overview

Command Center is a modular, full-stack productivity platform designed to replace Notion with a system you fully own and control. It consolidates task management, project management, meeting notes from Fathom, and calendar integration into a single, clean interface.

Built for scalability, this product is architected to serve as a personal command center today and a resellable SaaS product in the future.

Tech Stack

Frontend	React (Next.js) — responsive for mobile browser access
Backend / Database	Supabase (Postgres, Auth, Realtime, File Storage)
Hosting	Railway (auto-deploy from GitHub main branch)
Version Control	GitHub
IDE	Cursor with Claude Code
Auth	Supabase Auth (email/password + OAuth for future users)
Mobile	Progressive Web App (PWA) for home screen install

Core Modules

Task Management

- Daily to-dos, recurring tasks, deadlines, and priority flags.
- Kanban view (Backlog, In Progress, Done)
 - Simple list view for rapid execution
 - Priority flags and due date tracking
 - Recurring task support

Project Hub

Dedicated project spaces with roll-up visibility across all active work.

- Scope, deliverables, timeline, and linked files per project
- Tasks linked to projects for drill-down tracking
- Roll-up dashboard showing all active projects at a glance

Notes & Meeting Log

Quick capture for meeting notes, ideas, and follow-ups with automatic linking.

- Markdown-based notes for portability
- Auto-link notes to clients or projects
- Follow-up items auto-generate tasks

Calendar / Timeline View

Visual layer across tasks and projects for bandwidth planning.

- Syncs with Outlook Calendar via Microsoft Graph API
- Syncs with Apple Calendar via CalDAV / .ics feed
- Shows task deadlines and project milestones alongside meetings

Dashboard (Home Base)

The command center view. One screen to see everything that matters today.

- Today's priorities and overdue items
- Upcoming deadlines across all projects
- Recent activity feed
- Quick-add for tasks, notes, and meetings

Integrations

HubSpot (API)

Pull contacts, deals, and company data into the Client Tracker. Optional two-way sync for updates to flow back into HubSpot.

Outlook Calendar (Microsoft Graph API)

Read and write calendar events. Pull meeting details directly into the Meeting Log for notes and follow-ups.

Apple Calendar (CalDAV)

Subscribe via CalDAV protocol or .ics feed synced through Supabase. Apple Calendar is the most complex integration and should be scoped early in development.

GitHub

Baked into the deploy pipeline via Railway. Push to main branch triggers auto-deploy.

Design Principles

- Modular: Each module works standalone or together
 - Markdown-based notes for content portability
 - Universal tagging system across all modules
 - Global search that works across every module
 - Clean, minimal UI with no clutter or feature bloat
 - Role-based access for future team or resale use
 - Mobile-first responsive design via PWA
-
